PROFESSIONAL SUMMARY

Detail-oriented and self-driven Junior Data Administrator specializing in workflow automation and data engineering pipeline design. Experienced in constructing automated ETL (Extract, Transform, Load) pipelines utilizing n8n to integrate local/cloud datasets and external APIs directly into relational databases. Proficient in managing Linux environments and database systems to optimize operational efficiency and minimize manual human errors.

TECHNICAL SKILLS

Automation & ETL Tools: n8n Workflow Automation (Self-Hosted on Linux Environment).
Databases: PostgreSQL (Relational Database Management, Advanced Querying, Data Insertion/Updates).

Data Formats & Integrations: JSON Manipulation, REST APIs Integration, CSV Data Parsing.
Operating Systems & Management: Linux Bash, Directory Organization, GitHub/Git Workspace.
Communication & Alerts: Automated Messenger Bots Integration (Telegram Bot API, Slack Alerting).

KEY PROJECTS (PORTFOLIO)

Automated Real-Time Currency Exchange Data Pipeline

Designed and deployed an automated cloud-to-database ETL pipeline using n8n that requests daily currency rates from external REST APIs.

Configured Data Transformation (JSON Parsing) nodes to isolate specific financial attributes, ensuring only targeted records enter the data stream.

Built seamless data insertion scripts to update relational records inside a local PostgreSQL database. Integrated Telegram Bot API triggering real-time successful updates directly to management devices.

Automated Local Dataset File-to-Database Processor

Developed a schedule-triggered file listener in n8n to automatically load data spreadsheets directly from specific disk paths.

Successfully parsed unstructured CSV files containing multi-row customer transaction datasets into clean, relational database arrays.

Automated bulk inserting logic that synchronized 12 distinct financial logs per run, preventing double-entry and system lag.

EXPERIENCE

Independent Data Automation Developer & Admin | Self-Employed

June 2026 – Present

Maintained a suite of internal administration data projects (Sales Analysis, Employee Tracking, Financial Auditing) hosted on a Linux system.

Wrote detailed documentation (README.md), built custom relational schema configurations (.sql), and formatted standard input matrices (.csv) for optimal data management.

Successfully optimized business reporting workflows by replacing traditional manual input methods with trigger-based automated engines.

Automated Remote Data Administration & Customer Analytics Pipeline | GitHub:

`dynolinuxtech01/remote-data-admin-project`

- * Developed a schedule-triggered automated ETL pipeline in n8n (`Workflow_n8n.json`) to automatically fetch, parse, and process tabular business logs (`dataset6.csv`).

- * Designed and optimized relational database schemas (`create_table.sql`) inside PostgreSQL, ensuring correct data type normalization (such as auto-incrementing primary IDs and numeric precision).

- * Constructed analytical data extraction queries (`query_top_customer.sql`) to automatically isolate high-value client records and metrics for business intelligence reporting.

- * Integrated automated real-time notification

EDUCATION

Bachelor / Diploma / High School Certificate in Technical Major (High School Certificate in Technical Major of mechanical automotive).

Relevant Coursework: Relational Database Structures, Scripting Fundamentals, System Integration
